

An alert budget changes the operating cutoff

Synthetic walkthrough / learning references, choosing a candidate, and seeing the tradeoff

a Learn the practice references

LEARNING DATA / 8,400 synthetic encounters

b Apply an alert budget

SAME LEARNING DATA / capacity K = 1,680 alerts (20%)

References stay unchanged; operating choices are evaluated alongside them.

c Evaluate the fixed choices on separate data

HELD-OUT DATA / 3,600 synthetic encounters / no cutoff reselection

All observations are synthetic. A tighter alert budget reduces alerts and outcome coverage in this example.
