

Examine the action curve, then evaluate it separately

Clinical illustration / empirical support and held-out evaluation of recorded action probability

a Learning curve and sample support

MIMIC / 26 retained bins / 294,659 encounters represented

b Held-out action probability

MIMIC / 126,332 encounters / learning curve held fixed

Read the probabilities in context

REFERENCE TARGETS

Low: local action frequency
Mid: 0.50 / High: 0.80

OVERALL HELD-OUT ACTION RATE

Observed 32.45%

Mean prediction 33.37%

BRIER SCORE / LOWER IS BETTER

Fixed curve 0.1943

Constant learning rate 0.2192

MEANING

Recorded assessment
and treatment activity

Source windows vary across actions. Predictions use continuous interpolation with endpoint clipping; empty reliability bins are omitted.

Action probability describes recorded practice. It is distinct from outcome risk and from the proportion with action among all alerts.
